Thermal Test Socket Solutions

Machined single piece copper or nickel plated copper heat slug extends through the test socket and DUT board to contact the bottom side of the DUT.

(Left) Custom sized heat sinks can be built into the test socket and contact a mating pad on the DUT board.

(Right) Nickel plated copper lids contact the top side of DUT and include fins for improved heat dissipation.

Clamshell style test sockets with adjustable Z-axis copper heatsink, integrated thermocouple, heat spreader, and fan for DUT level thermal management.
